

Recovered from COVID-19?

You may be a candidate for Stanford Blood Center's convalescent plasma donation program

Stanford Blood Center is working with Stanford Medicine to establish a convalescent plasma program.

This exciting initiative involves taking plasma donations from recovered COVID-19 patients and transfusing that plasma into critically ill COVID-19 patients, in the hopes that the antibodies present in the donated plasma will help save the lives of the recipients.

To donate you must have had a positive test for COVID-19 and be at least 14 days symptom free. Additional eligibility criteria may also apply. For more information, or to apply to participate, visit stanfordbloodcenter.org/covid19plasma.
